1. True Or False: Today, due to developments in machine learning research, and performance improvements for mobile and edge devices, there exists a wide range of options to deploy a machine learning solution locally.

1 / 1 punto

- ○ False
- ◉ True

Correcto
That's right! With mobile devices becoming increasingly more powerful and at the same time cheaper, these devices are now able to deploy machine learning solutions at the edge.

2. Which of the following benefits does machine learning provide to mobile & IoT businesses that use it? (Select all that apply)

1 / 1 punto

- ☑ Strengthening security.

Correcto
That's right! With ever increasing number of breaches and confidential data theft, companies want to strengthen their security. Employing ML in mobile and IoT security can help detect intrusions, protect your data, and respond to incidents automatically.

- ☐ Eliminating risk.
- ☑ Improving user experience with data.

Correcto
That's right! Businesses with a mobile or IoT strategy know how technology can capture and transform data to offer greater access to consumer information and therefore devise better means to enhance their user experiences.

- [x] Automating operational efficiency.

Correcto
That’s right! Mobile and IoT deployments can streamline your business and help you make accurate predictions. Also, the automation of some processes can decrease the time of information analysis, and therefore, can be crucial to improve operational efficiency.

3. ML Kit brings Google's machine learning expertise to mobile developers. Which of the following are features of ML Kit? (Select all that apply) **1 / 1 punto**

- [ ] On-device model training
- [x] Access to cloud-based web services

Correcto
That’s right! With ML, you can upload your models through the Firebase console and let the service take care of hosting and serving them to your app users.

- [x] Model customization

Correcto
That’s right! With ML, you can customize your device ML features, such as facial detection, bar-code scanning, and object detection, among others.

- [x] Pre-trained model compatibility

Correcto
That’s right! With ML, you can use a pre-trained TensorFlow Lite set of vetted models, provided they meet a set of criteria.

4. In per-tensor quantization, weights are represented by int8 two's complement values in the range _____ with zero-point _____

1 / 1 punto

- (●) [-127, 127], equal to 0
- ( ) [-128, 127], in range [-128, 127].
- ( ) [-128, 127], equal to 0
- ( ) [-127, 127], in range [-128, 127].

Correcto
That's right! In per-tensor weights, there are two complement values in the range [-127, 127], with zero-point equal to 0 in approximates.

5. Quantization squeezes a small range of floating-point values into a fixed number. What are the impacts of quantization on the behavior of the model?

1 / 1 punto

- [x] Layer weights changes and network activations

Correcto
One of the significant impacts is the change of static parameters such as layer weights, and others could be dynamic such as activations within networks.

- [x] Changes in transformations and operation

Correcto
That's right! You could have transformations like adding, modifying, removing operations, coalescing different operations, and so on. In some cases, transformations may need extra data.

- [ ] Increased precision as a result of the optimization process

- [x] Decreased interpretability of the ML model

Correcto
That's right! In the case of ML interpretability, there are some effects imposed on the ML model after quantization. This means it’s hard to evaluate whether transforming a layer was going in the right. Therefore, the interpretability of the model may decrease.

6. True Or False: One family of optimizations, known as pruning, aims to remove neural network connections, increasing the number of parameters involved in the computation. **1 / 1 punto**

- ( ) True
- (•) False

Correcto
That's right! The pruning optimization aims to eliminate neural network connections, but instead of increasing the number of parameters, you have to reduce them. With pruning, you can lower the overall parameter count in the network and reduce their storage and computational cost.

7. Which of the following describe the benefits of applying sparsity with a pruning routine? (Select all that apply) **1 / 1 punto**

- [x] Gain speedups in CPU and some ML accelerators

Correcto
That's right! You can even gain speeds in the CPU and ML throttles that fully exploit integer precision efficiencies in some cases.

- [x] Can be used in tandem with quantization to get additional benefits

Correcto
That's right! In some experiments, weight pruning is compatible with quantification, resulting in compounding benefits. Therefore, it is possible to further compress the pruned model by applying post-training quantization.

- [ ] Method perform well at a large scale
- [x] Better storage and/or transmission

Correcto
That's right! An immediate benefit that you can get out of pruning is disk compression of sparse tensors. Thus, you can reduce the model's size for its storage and transmission by applying simple file compression to the pruned checkpoint.
